X-PENSE TRACKER

Every Rupee Accounted For User Guide · Version 2

Getting started

X-Pense Tracker records what you spend and keeps a running bank balance. Everything is stored on your own device — there is no account to create and no data leaves your phone or computer.

1 **Open the app.** On a phone, open the web address in Chrome, tap the ⋮ menu and choose Install app. On a computer, just open the file or the link.

2 **Set your bank balance.** Go to Settings, tap the amount next to your account, and enter what is actually in the bank right now.

3 **Add your accounts and cards.** Still in Settings, add each bank account you use, and each credit card. Three cards are set up already.

4 **Start adding expenses.** Tap Add at the bottom and fill in the form. That's it.

Adding an expense

The four tabs along the bottom are Add, History, Summary and Settings. Add opens by default.

- **Money out / Money in** — switch at the top. Money in records salary, refunds or any credit.
- **Amount** — type the figure. No need for the rupee sign.
- **Details / notes** — type what it was for. The app reads this and suggests a category; tap Use it to accept.
- **Category and sub-category** — pick a category, then a sub-category appears below it. You can also type your own, and it will be saved for next time.
- **Payment mode** — how you paid. Choosing Credit Card asks which card; choosing a bank mode asks which account.
- **Date** — today's date is filled in. Change it for an older expense.

Tap Add expense to save. The form clears and is ready for the next one.

How the bank balance works

Only money that genuinely leaves your bank account reduces the balance. Card spending is settled later, and cash has already left your hand, so neither is deducted.

Payment mode	Deducted	What happens
UPI	**Yes**	Asks which bank account, then reduces it.
Netbanking	**Yes**	Asks which bank account, then reduces it.
ATM Withdrawal	**Yes**	Asks which bank account, then reduces it.
Auto-debit / Mandate	**Yes**	For SIPs, EMIs and standing instructions.
Cheque / DD	**Yes**	Asks which bank account, then reduces it.
Credit Card	**No**	Asks which card. Tracked separately per card.
Cash	**No**	Recorded as spending only.
Other	—	Type what it was. Tick the box if it did come from a bank.

Money in follows the same rule in reverse: a credit received into a bank account increases the balance; cash received does not.

Seeing where your money went

Open the Summary tab. The arrows at the top move between periods, and the row below switches between Daily, Weekly, Monthly, Quarterly and Yearly. History goes back two years.

Three figures sit at the top: total spent, money in, and your current bank balance. Below them, the Breakdown chart has three views:

- **By category** — the big picture. Housing, Transport, Health and so on.
- **By sub-category** — the detail. Fuel separately from parking, groceries separately from eating out.
- **By payment mode** — one slice per credit card, plus a Bank balance slice split by account, so you can see what each card costs you.

Below the chart, a bar graph shows the trend across the period and a ranked list gives every category with its share of the total.

Finding an old entry

The History tab lists everything, newest first.

- **Search** — type anything: an amount, a shop name, a card, a category. It looks across every field.
- **Filters** — narrow by category, sub-category, payment mode or period. They work together.
- **Delete** — the × at the end of a row removes that entry and corrects your balance.

Backing up your data

Your records live in this browser on this device only. They are not sent anywhere, which keeps them private — but it also means nothing restores them if the device is wiped.

> Open Settings and tap Export JSON backup every week or so, then save the file to Google Drive. Clearing your browser data will erase every entry, and this backup is the only way to get them back. Use Import JSON backup to restore, or to move your records to a new phone.

Export CSV for Excel gives you a spreadsheet of every entry, useful at tax time.

Good habits

- Enter an expense as it happens. Catching up at the end of the week is when things get missed.
- Write a real note — "Blinkit weekly" rather than just "shopping". The suggestions get more useful, and so does the search.
- Correct the balance in Settings once a month against your real statement. Small gaps creep in from cash and late entries.
- Use one device for entry. Phone and laptop keep separate records; the JSON backup is the only bridge.

If something looks wrong

What you see	What to do
Balance seems too high	Something paid from the bank was logged as Cash or Card. Find it in History and re-enter it.
A card is missing from the list	Add it in Settings → Credit cards.
"Unassigned card" showing	Entries saved before cards existed. Re-enter them to assign a card.
Entries have disappeared	Browser data was cleared. Restore from your most recent JSON backup.
The app looks out of date	Close it fully and reopen — updates apply on next launch.
